

アニメク

Anime picks that **show** their math.

AniRec reads your MyAnimeList history and learns what you actually reach for. Every suggestion arrives with a match score, and with **the genres that produced it, adding up to the decimal**. No black box, no cloud, no account on anybody else's server.

GETTING THERE

Three steps, and only one of them needs your account.

The order matters. You should see the thing working before it asks you for anything.

01

Unzip and run

One folder, one executable. Python and every library it needs are already inside. Windows 10 or 11.

02

Look around first

A sample library opens on first launch: a real feed, real breakdowns, no account. Connect MyAnimeList when you want the picks to be about you.

03

Argue with it

Like it, pass on it, save it for later. The taste model updates on every decision and the rest of the feed reshapes to match.

WHAT IS IN THE BOX

The spec sheet.

SURFACES	Discover, My Library, Settings
SCORING	A genre-weighted taste model learned from your own ratings, plus the community score
EXPLANATION	Per-title contribution breakdown that sums to the match percentage shown beside it
FEEDBACK	Liked, Not for me, and Watch Later, kept per profile and keyed by MyAnimeList ID
SAMPLER	One Adventurousness control, Familiar through Surprising
LAYOUTS	Grid, list, and table, each remembered between sessions
THEMES	Light, dark, OLED black, and a gradient built from two colours you pick
TYPE	A font scale that moves the whole hierarchy together
DATA SOURCE	The official MyAnimeList API, over OAuth, with tokens stored on your machine
ALSO INCLUDED	The original command-line workflow, and developer tools for each pipeline step

PLATFORM	Packaged build for Windows 10 and 11; runs from source on Python 3.10 and newer
LICENCE	GNU General Public License v3.0

WHERE YOUR DATA GOES

Nothing leaves this machine.

AniRec reads your viewing history. That is a reasonable thing to be careful about, so here is the whole story.

On your disk

Ratings, tokens, generated results, and cached covers all live in your local AniRec application-data folder. Clear any of it from Settings.

One server, with permission

AniRec talks to the official MyAnimeList API and nothing else. You approve the connection in your own browser, and your password never reaches the app.

No telemetry

No analytics and no account on our side, because there is no our side. Logs are written locally and redacted before anything is stored.

ANIREC 1.3.0 · WINDOWS · FREE

Stop guessing what to watch.

Download it, open the sample library, and see whether the numbers convince you. That takes about a minute.
